6005
6006    ; Note about the internal Skyrim implementation of the string classes used for scripting:
6007    ; the strings are case-insensitive.  Each BSFixedString is managed in a cache and reused
6008    ; everywhere it is needed.  This means that strings like "O" and "o" are technically
      equivalent;
6009    ; Which string is used depends greatly on which version is found first.  We are
      investigating
6010    ; how to manage this, but for the time being be aware that the distinction between
      uppercase
6011    ; and lowercase may not exist.  It also means that functions below returning an integer
6012    ; for the character may not correspond exactly.  Also GetNthChar("Hello Skyrim!", 4) will
6013    ; return a string with either "O" or "o" depnding on which might be registered first.
      All
6014    ; my tests so far have it return the uppercase, eventhough in the string it is lowercase.
6015    ; We may solve this problem by switching back to returning an integer rather than a
      string
6016    ; for GetNthChar, but this will still have problems.
